Runtime capability loading and the six-view simulation platform

14 MCP tools (in-process reuse of mcp_server.py function bodies):

A 6	B 5	C 2	D 1

12 operators: import + callable verified
(not os.path.exists)

Four independent admission gates on POST /api/invoke:

whitelist (14)	5 forbidden L3 keys	opt_in = true	confirm = true

Six browser-rendered views (T8 screen-by-screen re-verification):

overview	topology	batch	channels	operators	**workbench**

Additive HTTP surface (L0 /api/simulate body unchanged):

GET /api/health | GET /api/ops | GET /api/evidence | POST /api/invoke
POST /api/simulate remains the frozen L0 baseline (function body unchanged)

Gate PASS 25/25 | final check 20/20 | contract v1.97 | port 8771 (8770 untouched) | zero pageerror / console error / 4xx across six views

Two naming defects (hier_est -> hier_fit, conservation_metrics -> element_balance) were invisible to file-existence checks and were exposed only by runtime verification.
